Class Stone

[java.lang.Object](#)
 [modele.Occupant](#)
 [modele.occupant_no_moveable.Stone](#)

All Implemented Interfaces:

[Questionable](#)

```
public class Stone
  extends Occupant
```

Stone class that makes up the walls

Constructor Summary

Constructors

Constructor	Description
Stone (Position position)	Constructor of the class Stone A stone is cannot be walked on

Method Summary

All Methods	Instance Methods	Concrete Methods
-------------	------------------	------------------

Modifier and Type	Method	Description
boolean	isStoneBroken()	Check if the stone is broken
void	process (Character m)	Process the interaction between a character and the stone It breaks the stone for a short period of time if the character has a pickaxe (only hunters can have a pickaxe) Otherwise, it will make the character go to the closest side of the wall using the tempDir attribute of the character
void	setWall (Wall wall)	Set the wall of the stone this function is called by the wall and only by the wall

Methods inherited from class `modele.Occupant`

`equals, getCol, getPosition, getRow, isStepEnabled, setPosition`

Methods inherited from class `java.lang.Object`

`clone, finalize, getClass, hashCode, notify, notifyAll, wait, wait, wait`

Constructor Detail

Stone

```
public Stone(Position position)
```

Constructor of the class Stone A stone is cannot be walked on

Parameters:

`position` - the position of the stone

Method Detail

process

```
public void process(Character m)
```

Process the interaction between a character and the stone It breaks the stone for a short period of time if the character has a pickaxe (only hunters can have a pickaxe) Otherwise, it will make the character go to the closest side of the wall using the `tempDir` attribute of the character

Specified by:

`process` in interface `Questionable`

Specified by:

`process` in class `Occupant`

```
public boolean isStoneBroken()
```

Check if the stone is broken

Returns:

true if the stone is broken, false otherwise

setWall

```
public void setWall(Wall wall)
```

Set the wall of the stone this function is called by the wall and only by the wall

Parameters:

wall - the wall to set

toString

```
public java.lang.String toString()
```

Return the string representation of the stone If the stone is broken, it will return " " for a short period of time and decrease the brokenTime attribute

Specified by:

[toString](#) in class [Occupant](#)

Returns:

the string representation of the stone : "#" if the stone is not broken, " " otherwise
